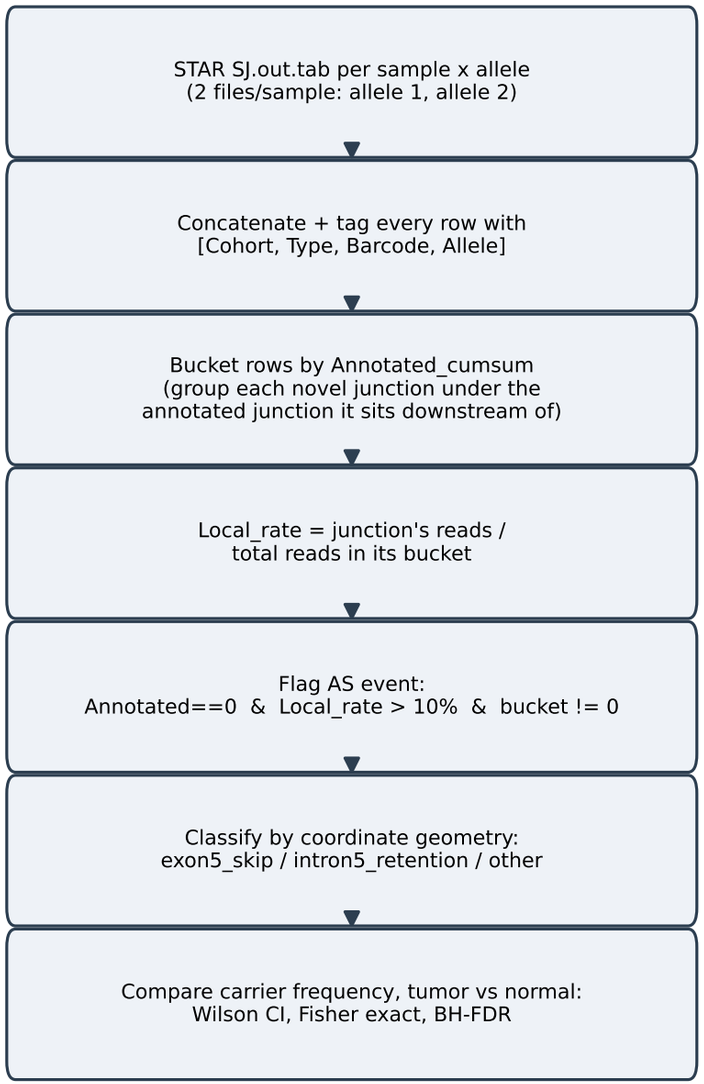
Background & method: how an HLA-A splice-junction file becomes a tumor-vs-normal test

Pipeline: from raw STAR output to a tested carrier-frequency difference

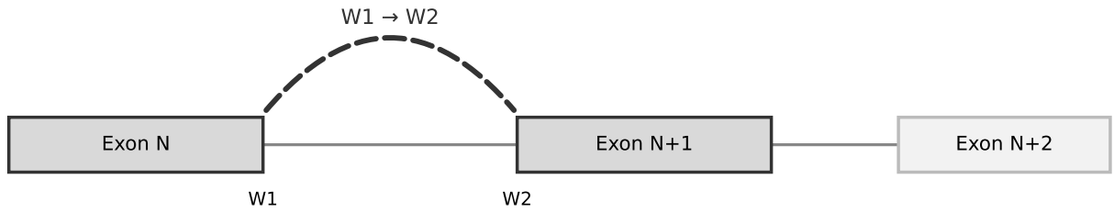
A



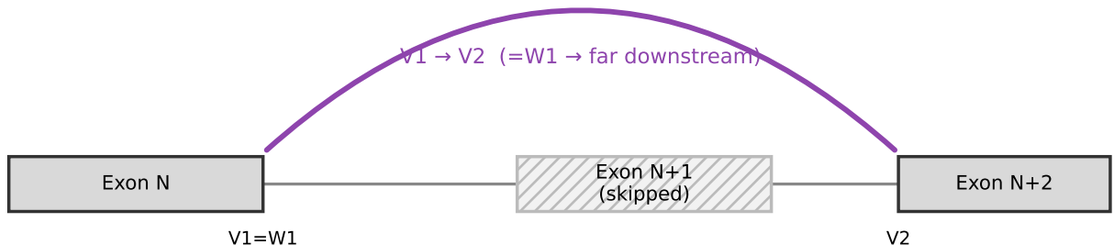
What the two named events look like (coordinates: W = annotated junction, V = variant junction)

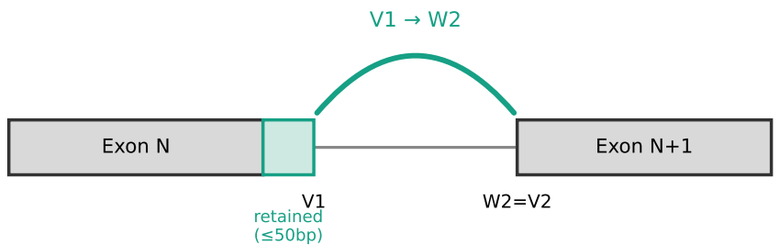
B

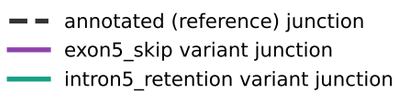
Annotated (reference) splicing



exon5_skip: same donor, acceptor jumps far downstream (V1=W1, V2−W2≥100bp) → Exon N+1 skipped entirely







intron5_retention: same acceptor, donor shifts a few bp downstream (V2=W2, 0<V1−W1≤50bp) → partial intron retained
